TITLE: Iron for castings undergoing friction and cyclic loads - contains silicon, manganese, chromium, copper, molybdenum, vanadium, phosphorus, nitrogen, antimony, niobium and rare earth(s)

INVENTOR: BONDAREV, M M; GROMYKO, I M ; MIKHAILOVS, V M

PRIORITY-DATA: 1987SU-4281075 (July 13, 1987)

PATENT-FAMILY:

PUB-NO	PUB-DATE	LANGUAGE	PAGES	MAIN-IPC
SU 1454873 A	January 30, 1989		004	

INT-CL (IPC): C22C 37/00

ABSTRACTED-PUB-NO: SU 1454873A

BASIC-ABSTRACT:

The iron contains (in wt. %): C 3.2-4.5, Si 2.0-2.8, Mn 0.1-0.4, Cr 0.6-1.2, Cu 0.8-1.4, Mo 0.6-1.0, V 0.2-0.6, P 0.2-0.6, N2 0.01-0.02, Sb 0.02-0.04, rare earth elements 0.005-0.01 and balance Fe.

Cr is a strong carbide-forming element that increases the hardness and wear resistance of the iron significantly.

ADVANTAGE - The impact-fatigue is increased, while the level of wear-resistance is maintained.

In an example, the impact-fatigue durability was raised from 110 to 166 times 10 power 2 cycles before failure. The wear resistance factor was reduced at the same time from 1.8 to 1.1g. Bul.4/30.1.89.

INT-CL (IPC): C22C 37/00

ABSTRACTED-PUB-NO: SU 1108123A

BASIC-ABSTRACT:

Addn. of Mo, Ca and rare earth metal or Sb to grey cast iron, increases its wear resistance and machinability. The mixt. contains (in wt.%): C 2.2-3.3, Si 2.2-3.2, Mn 0.5-1.2, Ti 0.3-0.8, Mo 0.1-0.9, Ca 0.03-0.20, rare earth metal or Sb 0.02-0.1 and Fe the rest.

A typical mixt. contains (in wt.%): C 2.2, Si 3.2, Mn 0.5, Ti 0.3, Mo 0.1, Ca 0.03, Sb 0.02, S 0.02 and P 0.07. Tests show that addn. of the above listed metals increases tensile strength of the material from 256 to 312-368 MPa and working life of the element from 72 to 106-162 hours, and reduces wear under 5 MPa load with sliding friction, from 84 to 45-72 mg/km.

USE - Mfr. of elements for friction nodes, etc. Bul.30/15.8.84
